Statement of Verification

BREG EN EPD No.: 000384 Issue 02

This is to verify that the

Environmental Product Declaration

provided by:

Sika Services AG

is in accordance with the requirements of:

EN 15804:2012+A2:2019

and

BRE Global Scheme Document SD207

This declaration is for:

1 kg Sika MonoTop®-1010

Company Address

Tueffenwies 16
Zurich
8048
Switzerland

Declared Unit	**Applicability/Coverage**
1 kg of concrete repair coating	Product Average.
EPD Type	**Background database**
Cradle to Gate with options	GaBi

Demonstration of Verification
CEN standard EN 15804 serves as the core PCR [a]
Independent verification of the declaration and data according to EN ISO 14025:2010 ☐Internal ☒ External
(Where appropriate [b])Third party verifier: Nigel Jones
a: Product category rules b: Optional for business-to-business communication; mandatory for business-to-consumer communication (see EN ISO 14025:2010, 9.4)

Comparability
Environmental product declarations from different programmes may not be comparable if not compliant with EN 15804:2012+A2:2019. Comparability is further dependent on the specific product category rules, system boundaries and allocations, and background data sources. See Clause 5.3 of EN 15804:2012+A2:2019 for further guidance

Manufacturing site(s)

The environmental product declaration is for 1 kg of Sika MonoTop®-1010 produced by Sika Österreich GmbH at following manufacturing facilities:

Sika Österreich GmbH
Bingser Dorfstraße 23
Postfach 168
6700 Bludenz
Austria

Construction Product

Product Description

Sika MonoTop®-1010 is a 1-part, cementitious, polymer-modified, coating material used as bonding primer and reinforcement corrosion protection. It contains recycled waste materials (supplementary cementitious materials) and can reduce the carbon footprint application activity calculations. Sika MonoTop®-1010 can be applied in layers with thickness of 1 mm, with a fresh density of 2.0 kg/L.

Technical Information

Property	Value, Unit
Compressive strength after 28 days	~50 MPa
Tensile adhesion strength	~2.0 MPa
Shear adhesion strength	Pass the requirements
Diffusion resistance to water vapour	~100 μH_2O
Diffusion resistance to carbon dioxide	~1200 μCO_2
Corrosion test	Pass according EN 15183

Further information about the product including product data sheet can be accessed via www.sika.com

Main Product Contents

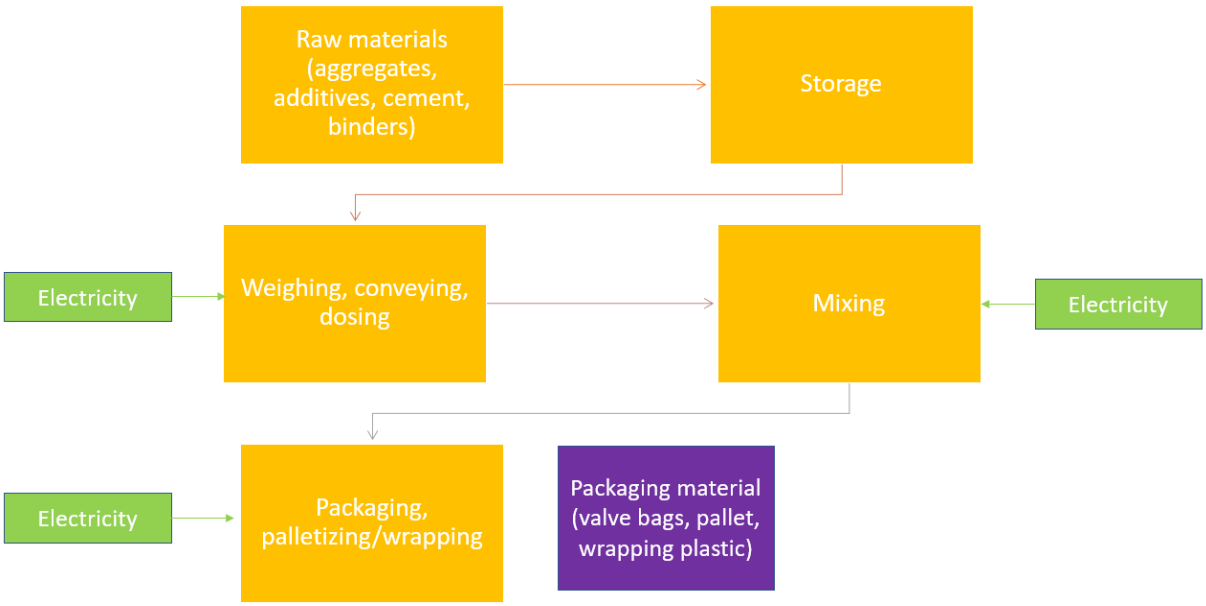
Material/Chemical Input	%
Hydraulic Binders	30 - 35
Functional Fillers	40 – 50
Supplementary Cementitious Material (SCM) Reactive Binders	10 – 15
Active Polymers and Additives	0 – 3

Manufacturing Process

The Sika MonoTop®-1010 is manufactured in a conventional mortar plant in Bludenz, Austria.

The raw materials are stored after the quality control testing is passed. The majority of the raw materials are dosed automatically into the mixers after the weighing and dosing phase. If resulting material does not pass the quality test, it will be reworked and send back to the mixing station. After confirming expected results it is send to the packaging station.

Process flow diagram



Construction Installation

Sika MonoTop®-1010 is a bonding primer and reinforcement corrosion protection cement-based slurry that is applied over the prepared steel rebars and concrete substrate after a proper mixing with water. The material can be hand applied or machine applied depending on the volume and area to be applied. The consumption of the material will depend on the roughness and quality of the substrate, as average is between 1.5 and 2.0 kg/m^2/mm. The product is only intended for professional use. Please refer to the product data sheet and method statement for detailed instructions.

Use Information

During the services life of the building or infrastructure there is no extraordinary maintenance, repair/refurbishment or replacement required, if Sika MonoTop®-1010 is correctly and properly applied.

The high durability and reliability of the structural concrete repair mortar Sika MonoTop®-1010 will limit any repair work to a minimum.

End of Life

At the end of its service life the building is demolished and as the Sika MonoTop®-1010 is attached to the concrete/ steel it is generally taken to landfill. The demolition process concerns mainly the concrete structure of which Sika MonoTop®-1010 is a minor part.

Life Cycle Assessment Calculation Rules

Declared unit description

1 kg Sika MonoTop®-1010.

System boundary

In accordance with the modular approach as defined in EN 15804, this cradle to gate with options EPD includes the product stage (A1-A3), construction process stage (A4-A5), end-of-life stage (C1-C4) and benefits beyond the system boundary (D).

Data sources, quality and allocation

The primary data provided by Sika derive from the plant in Bludenz, Austria for 2020. Mass allocation was applied to generate data per declared unit of product. Background LCI datasets are taken from the databases of GaBi software and ecoinvent Version 3.7.1. All datasets are less than 10 years old.

Benefits from incineration of packaging are included as benefits in Module D; this also applies to the reuse of wooden pallets.

Cut-off criteria

All data was taken into consideration (recipe constituents, thermal energy used, electricity used). Transportation was considered for all inputs and outputs. The manufacturing of the production machines and systems and associated infrastructure were not considered in the LCA.

Module D	The benefits from incineration of waste produced during installation are credited in Module D as avoided generation of electricity and thermal. The partial reuse of pallets from packaging is also included in Module D as avoided production of new pallets.		

Summary, comments and additional information

Interpretation

Figure 1 shows the relative contributions of the different modules to the various environmental impact categories and to primary energy use in a dominance analysis.

As can be seen from the results, the product stage (Modules A1-A3) contributes the most significantly to all environmental impact categories and primary energy use. For this reason, the product stage is examined more closely in the following interpretation.

The dominant influence in all environmental impact categories arises from the raw materials involved in the production of the product, which represent at least 90% of the impacts in each environmental impact category. The exceptions are ODP, EP-freshwater, and PERT. For ODP, 14% of the impacts arise from the production process, 3% from the packaging and 83% from the raw materials. For EP-freshwater, 15% of the impacts arise from the production process, 11% from the packaging and 74% from the raw materials. For PERT, 6% of the impacts arise from the production process, 17% from the packaging and 76% from the raw materials.

Within the raw materials, the binders play an important role in terms of GWP (79%), AP (59%), EP -marine (62%), EP- terrestrial (62%), POCP (62%), and PERT (85%). The influence of the additives can be seen in ODP (100%), EP – freshwater (96%), ADPE (94%) and WDP (84%). The influence of the fillers is minimal compared to the other material components, although they make up a relatively high proportion of the total product formulation.

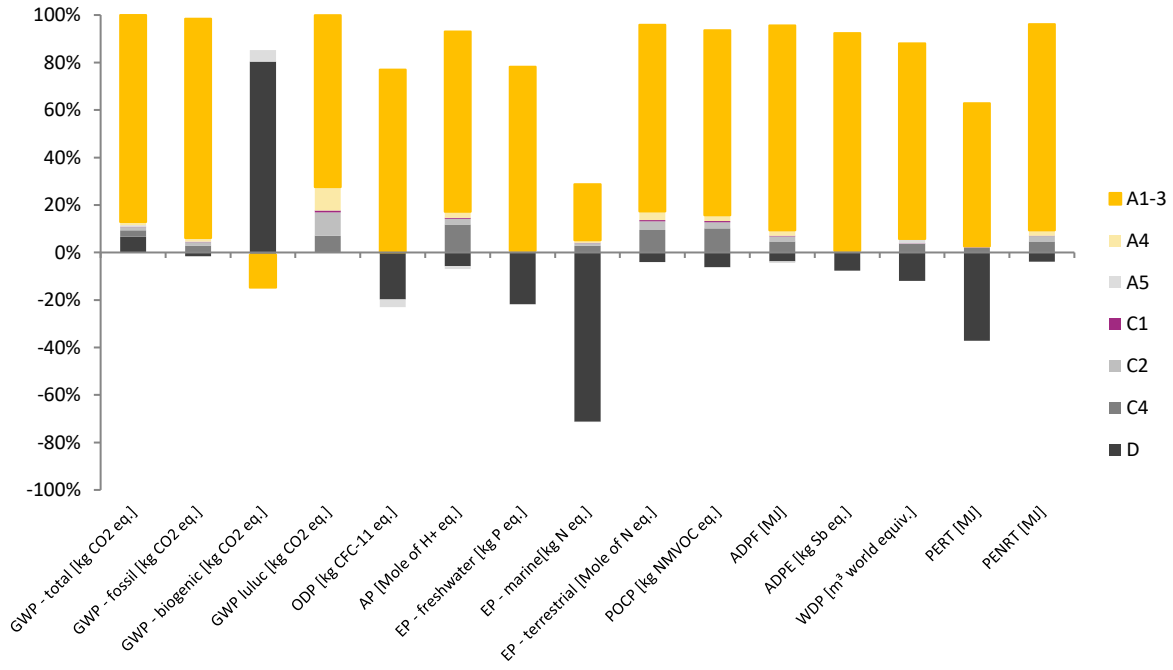

Figure 1: Relative contribution of the modules to the impact categories and primary energy demand for 1 kg Sika MonoTop®-1010.
